**INTERNAL CORRESPONDENCE**

**FROM:** O. W. Beasley

**DATE:** November 27, 2007

**TO:** John Parham

**LOCATION:** Power Supply  
Services

**SUBJECT:** Coal Unit Operation after Certain Maintenance Upgrades

There have been many discussions on the decision made to operate the coal units at or below the original design conditions after the subject maintenance upgrades. In an attempt to clarify for all parties, I will try to state the decisions made and help to understand the reasons for those decisions.

It was decided when we made the upgrades that Power Supply would operate, for at least five years after the last upgrade to a unit, at or below the original design conditions of the unit. For the five existing units this is 2400 psig, 1000<sup>0</sup>F./ 1000<sup>0</sup>F. This would be equivalent to the design heat input to the units from original design. It is recognized the units will make a few more Megawatts output due to efficiency improvements and we should utilize that improvement. We agreed to not take full advantage of the upgrade capability due to environmental considerations that could be imposed on the units.

I hope this clarifies the decision and allows each plant to set goals around these parameters.

Sincerely,

O. Wayne Beasley P.E.  
Manager, Power Supply Services
